Ccna course in nepal. Ccna course price in nepal. Ccna training in nepal. Ccna course fees in nepal. Ccna exam fee in nepal.

Most routers for the home don't do a very good job at filtering objectionable web content. One possible solution is to turn a Raspberry Pi into a proxy web filter that can protect users on your home network. In this lab, I turn a Raspberry Pi running the Raspbian Linux operating system into a robust web proxy that filters objectionable web sites. In order to turn the Raspberry Pi into a web proxy I install and configure Squid and SquidGuard, and then I download and configure a blacklist file which is available for personal use through a creative commons license. This lab focuses on turning the Raspberry Pi into a standalone proxy server that can be reached by changing the network clients web browser proxy settings, or by configuring the router to direct web traffic to the proxy server. In a follow up lab, you could configure the Raspberry Pi as a transparent inline proxy server. Step-by-step instructions First, I recommend updating your repositories and then installing the program locate and updating the index/database of file locations. This will help you if you need search for the file paths to the Squid and SquidGuard configuration files. After installing Squid and SquidGuard you will want to run the sudo updatedb command again in order to make the newly installed files indexed and searchable with locate. \$ sudo apt-get update \$ sudo apt-get install locate \$ sudo updatedb 1. Install Squid, start it, and set it to start on boot \$ sudo apt-get install squid3 \$ sudo update-rc.d squid3 enable Use netstat to check to see if Squid is listening on port 3128, also using ps notice that one of the process ids that Squid uses is proxy:proxy for the user and group \$ sudo netstat -antp |grep squid \$ sudo ps -aux |grep squid 2. Edit the Squid configuration file and then reload Squid. Notice, that I run updatedb and then use locate to find the location of the squid.conf file \$ sudo updatedb \$ sudo locate squid.conf \$ sudo du -sh \$(find /etc -name squid.conf) 3. Download the blacklist file to your Downloads or home folder but before you install a full blacklist file create a testdomain file with test domains for SquidGuard to practice blocking \$ cd /var/lib/squidguard/db \$ sudo nano testdomains type in three lines of text to add some test-domains to block: yahoo.com msn.com whatever-you-want-to-block.com save and exit. 7. Now edit the squidGuard.conf file to configure it to work with the testdomains file. You may want to back up the squidGuard.conf file before making changes. \$ cd /etc/squidguard \$ sudo cp squidGuard.conf squidGuard.conf.bak \$ sudo nano -c /etc/squidguard/squidGuard.conf In the config file, add the following text elements in red. Be careful in your edits, incorrect syntax will cause squidGuard to fail. The beginning of the text file has been omitted. #dest adult { #A AA A domainlistA AA AA A A AA AA A BL/porn/domains #A AA A urlistA AA AA A A AA AA A BL/porn/urls #A AA A expressionlistA AA AA A BL/adult/expressions #A AA A redirect # } dest test { domainlist testdomains } { admin { pass any } foo-clients within working hours { # have a good time! IN-ADDR! ADULT ANY } { pass any } bar-clings { pass local none } default { pass! test any redirect save and exit 8. now install the Apache2 web server and Create a blocked. HTML Page using Nano \$ Sudo Apt-Get install Apache2 # CD/Var/www/html \$ Sudo Nano Blocked.html # Html Property 0%0mba =>0, 0%0prian0%AMob \* 0%0, 0%riano0%zacc...D \* 0%0, 0%rian ". Now you need to compile the Squidguard black lists. 10. Now give Squid3 property or access to some of the Squidguard files and directories: \$ Sudo Chown -r proxy: proxy/var/lib/squidguard/db sudo chown -r proxy: proxy/var/log/squidguard \$ Sudo Chown -r Proxy: proxy/usr/bin/squidguard 11. edit the squid. CONF file and then recharge Squid \$ sudo nano -c /etc/squid3/squid.conf aa ± admit the next line to squid. CONF FILE ARUND LINE 4168: URL\_REWRITE PROGRAM/USR/BIN/SQUIDGUARD \$ SUDO SERVICE SQUID3 Reload 12. Now open the Firefox browser of another computer and test to see if the domains listed in the testdomains file in step 6 are blocked with xito The domains not listed in the Testdomains archive must be allowed. In other words, from another computer with the web browser configured with the proxy configuration of the Raspberry Pi IP address and port number 3128, try to navigate to MSN.com or one of the domains listed in the testdomains file that believed in step 6 13. If you had a ä © xito when blocking the testdomains then is the time to extract and decompress the shallist. Tar.gz Archive that they downloaded in Step 6. When you extract the shallist. Tar.gz will be extracted in a folder entitled Bl. Then you will copy the Squidguard DB \$ cd ~/Downloads \$ Tar -xzf Shallist folder. tar.gz \$ ls \$ sudo cp bl -r/var/lib/squidguard/db \$ cd/var/lib/squidguard/db now changes recurrently on the BL blacklists folder so you can list through the various blacklist categories that you may wish to activate. You will need to know the name paths of the categories, folders and files that you will want to compile to work with SquidGuard \$ sudo chmod -R 755 /var/lib/squidguard/db/BL \$ sudo chown -R proxy:proxy /var/lib/squidguard/db/BL \$ ls /var/lib/squidguard/db/BL 14. Now you can edit the squidGuard.conf file to configure it to begin blocking undesirable content \$ sudo nano -c /etc/squidguard/squidGuard.conf in the config file, change the following lines in red. Be careful in your edits, incorrect syntax will cause squidGuard to fail. You will need to add a dest gamble block as well as changing the paths to the content you intend to block. Notice under dest gamble that I change the paths under domainlist and urlist to match the content and paths in the BL folder #test adult { #A AA A domainlistA AA AA A A AA AA A BL/porn/domains #A AA A urlistA AA AA A A AA AA A BL/porn/urls #A AA A expressionlistA AA AA A BL/adult/expressions #A AA A redirect # } dest test { domainlist testdomains } dest gamble { domainlistA AA AA A A BL/gamble/domains urlistA AA AA AA AA AA AA AA AA AA AA A BL/gamble/urls } acl { admin { pass any } foo-clients within workhours { #A AA AA AA AA A A AA A pass good lin-addr /adult any } else { pass any } bar-clients { pass local none } default { pass /gamble /test any redirect } } Save and exit 15. Now you need to recompile the SquidGuard blacklists which will create new squidGuard blacklist database files. Then change ownership of the files in the db folder to proxy \$ sudo squidGuard -C all \$ sudo chown -R proxy:proxy /var/lib/squidguard/db 16. Reload Squid and then use Firefox from another computer to test to see if odats e odats e 3diuqs ogses odus \$ ragracer 3diuqs oicvres odus \$ lenoicnuq en euq ed osac neA ... allatnap al ed areuf odartsarra bew rodagevan led aRoyam al noc o odavirp ne abeurp atse ratuceje eesed euq elbisop eE .odiconc solluda arap odinetnoc noc bew soitss sol odnaeuqob jAtse draugdiuqS y
